

In this project I used express Node.js as framework and mongoose database and local host from postman.

- Firstly I made a directory in cmd:
 1. **mkdir "name_of_my_project"**
 2. **cd "name_of_my_project"**
 3. **npm init**
after it I name the package name (by name of my project) and add description then keep skipping defaults values then yes after finishing and for me I used visual studio code as editor.
- Afterwards open terminal in vs code and type : **npm install --save express**
- And I used a method to facilitate running my code where it automatically run code after I do any save in my code called nodemon and installed it in terminal of vs code:
npm install --save-dev nodemon
to start the code for first time type in terminal :
npm start
- I added too a log in package for node js called morgan and installed it in the terminal :
npm install --save morgan
- **npm install --save body-parser**
- **npm install --save mongoose**
- shutdown the connection of server and add : **npm install bcrypt--save**
- //for decryption of the session token after login :
npm install jsonwebtoken--save
- to restart the connection anytime type: **npm start**
